EXAMPLE

Determining experience level for a snowboard

```
price = 999.99  
  
if price > 500:  
    print('This snowboard is designed for experienced users.')
```

`print('This code will run whether or not the if statement is True.')`

This product is for experienced users.
This code will run whether or not the if statement is True.

How does this code work?
