F-STRINGS

You can include variables in strings by using **f-strings**

- This allows you to change the output text based on changing variable values

```python
name = 'Chris'
role = 'employee'

print(f"{name} is our favorite {role}, of course!")
```
```
Chris is our favorite employee, of course!
```

Add an **f** before the quotation marks to indicate an f-string, and place the variable names into the string by using curly braces **{}**

```python
name = 'Anand'
role = 'customer'

print(f"{name} is our favorite {role}, of course!"
```
```
Anand is our favorite customer, of course!
```

Note that the f-string code doesn't change, but the output does change if the variables get assigned new values
