STRING SLICING

EXAMPLE | *Grabbing components of a text string*

```python
message = 'I hope it snows tonight!'
message[-1:-9:-1]
```

```
'!thginot'
```

How does this code work?

- **Start: -1** – start with the last element in the string

- **Stop: -9** – stop at the ninth element from the end of the string without including it

- **Step size: -1** – return every single element in the range, going backwards
