STRING SLICING

EXAMPLE | *Grabbing components of a text string*

String Basics

String Arithmetic

Indexing & Slicing

String Methods

F-Strings

```
message = 'I hope it snows tonight!'
message[::-1]
```

```
'!thginot swons ti epoh I'
```

How does this code work?

- **Start: -1** – start with the last element in the string by default, due to the negative step size

- **Stop: -25** – stop at the beginning of the string

- **Step size: -1** – return every single element in the range, going backwards
